

Feedback

- Almost all the questions are answered promptly and immediately by the engineer from ORBIT.
- The visible online scheduler allows experimenters whose experiments clash to coordinate with each other.
- ORBIT provides full access to the WiMAX subscriber stations, as well as transferred data. With our WiMAX experiment, we need to program at a lower level to program subscribers as DoS attackers. It was almost impossible for us to conduct some experiments, such as launching DoS attacks on the network, in our previous collaboration with commercial telecommunication vendor.
- It would be even better if the experimenters are provided with more access to the WiMAX base station.
- OMF is a very useful tool, which allows experimenters to run their applications on multiple nodes efficiently.
- As the only resource for OMF users, an adequate online tutorial would not only help experimenters accelerate learning curve, but also avoid unnecessary detours.
- More ED fexample
