

VIRTUAL NETWORK MIGRATION

Samantha Lo, Yimeng Zhao, Mostafa Ammar, Ellen Zegura

Why Virtual Networks (VNs)?

- Solution to network ossification [Turner & Taylor, 2005, Anderson et al., 2005, Bavier et al., 2006]
 - Without major changes on the existing network architecture
 - Provide realistic environment for deploying new architectures and applications
 - A path to experiment with deployments
- Provide isolation
- Network agility
 - Can be set-up, taken down, changed and moved quickly

What is a VN?

Virtual
Networks

Physical
Network

What is a VN?

Virtual Networks

Physical Network

The VN Migration Problem

Initial Placement

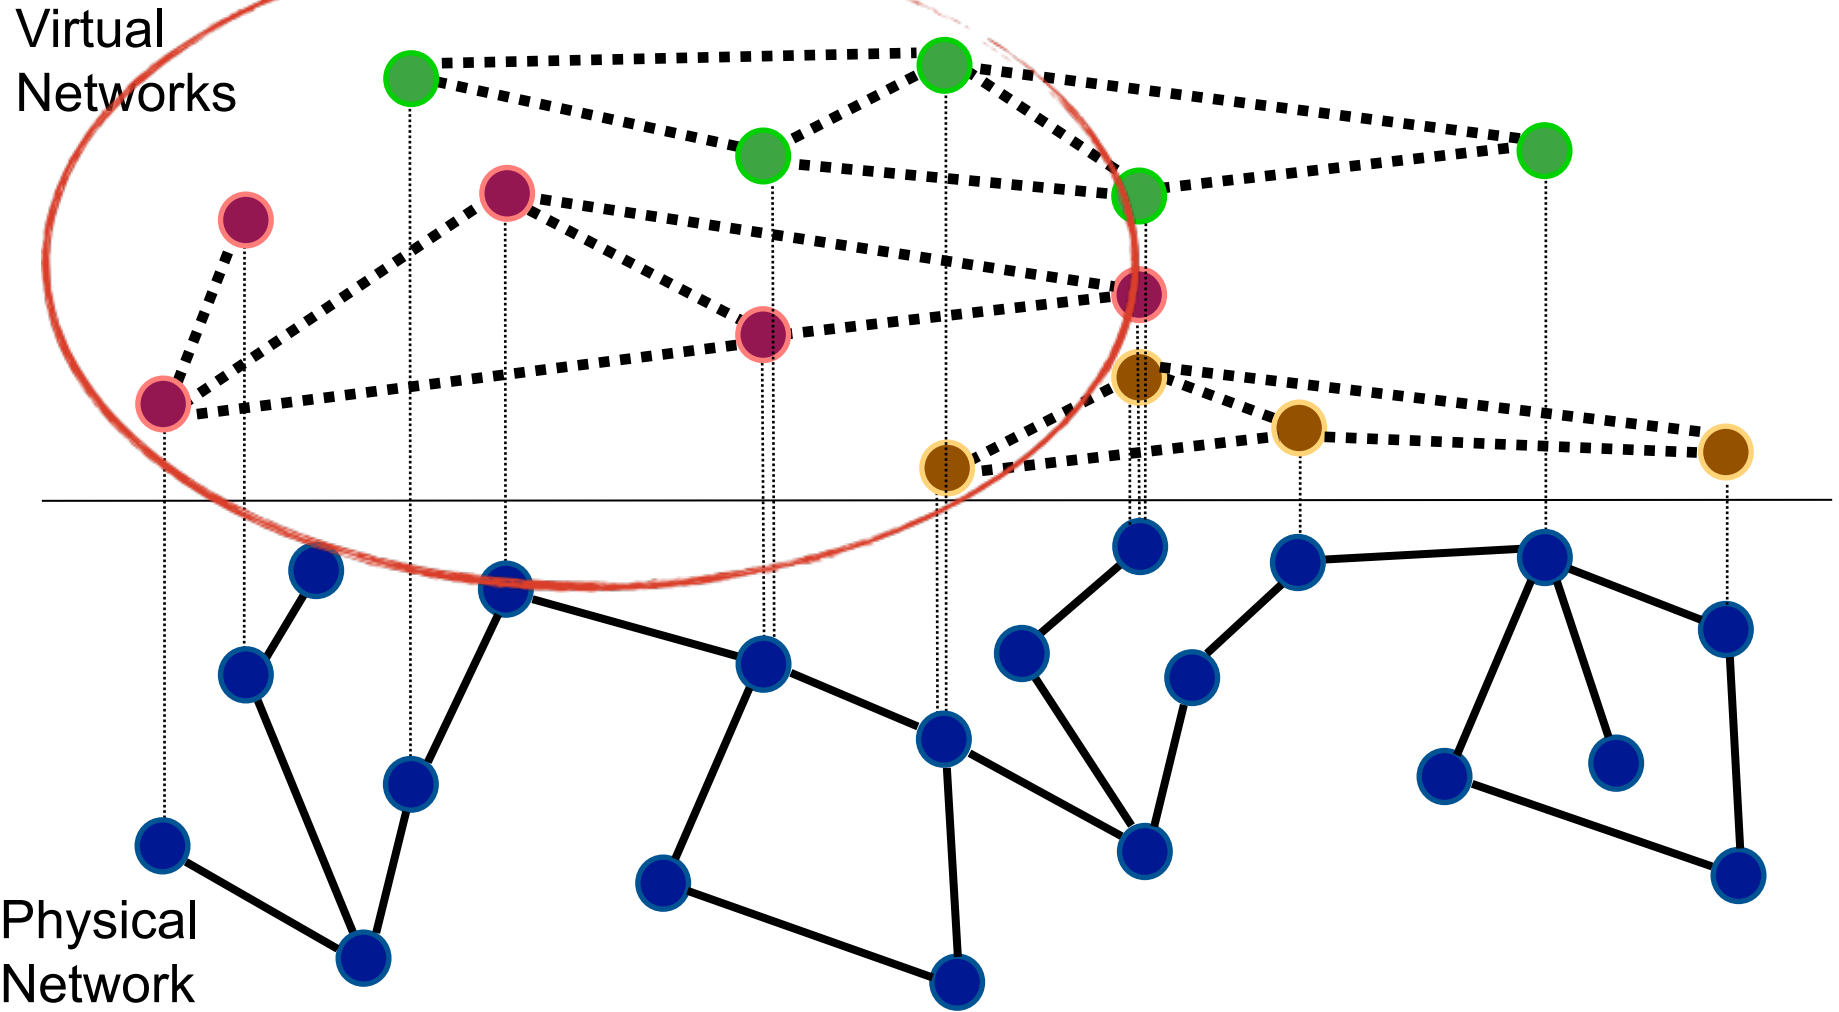

Final Placement

Why do we need to move?

Fault Tolerance

Virtual
Networks

Physical
Network

VN Migration Problem – Mechanism

- Focus of this work: How to migrate
 - Virtualization technology
 - Scheduling
- Limited work:
 - Migrating single virtual router
 - [Wang et al., 2008]
 - Scheduling migration
 - [Lo et al., 2013]
 - Network migration on PlanetLab
 - [Lo et al., 2014]

VN Migration on PlanetLab

(Published in IFIP Networking 2014)

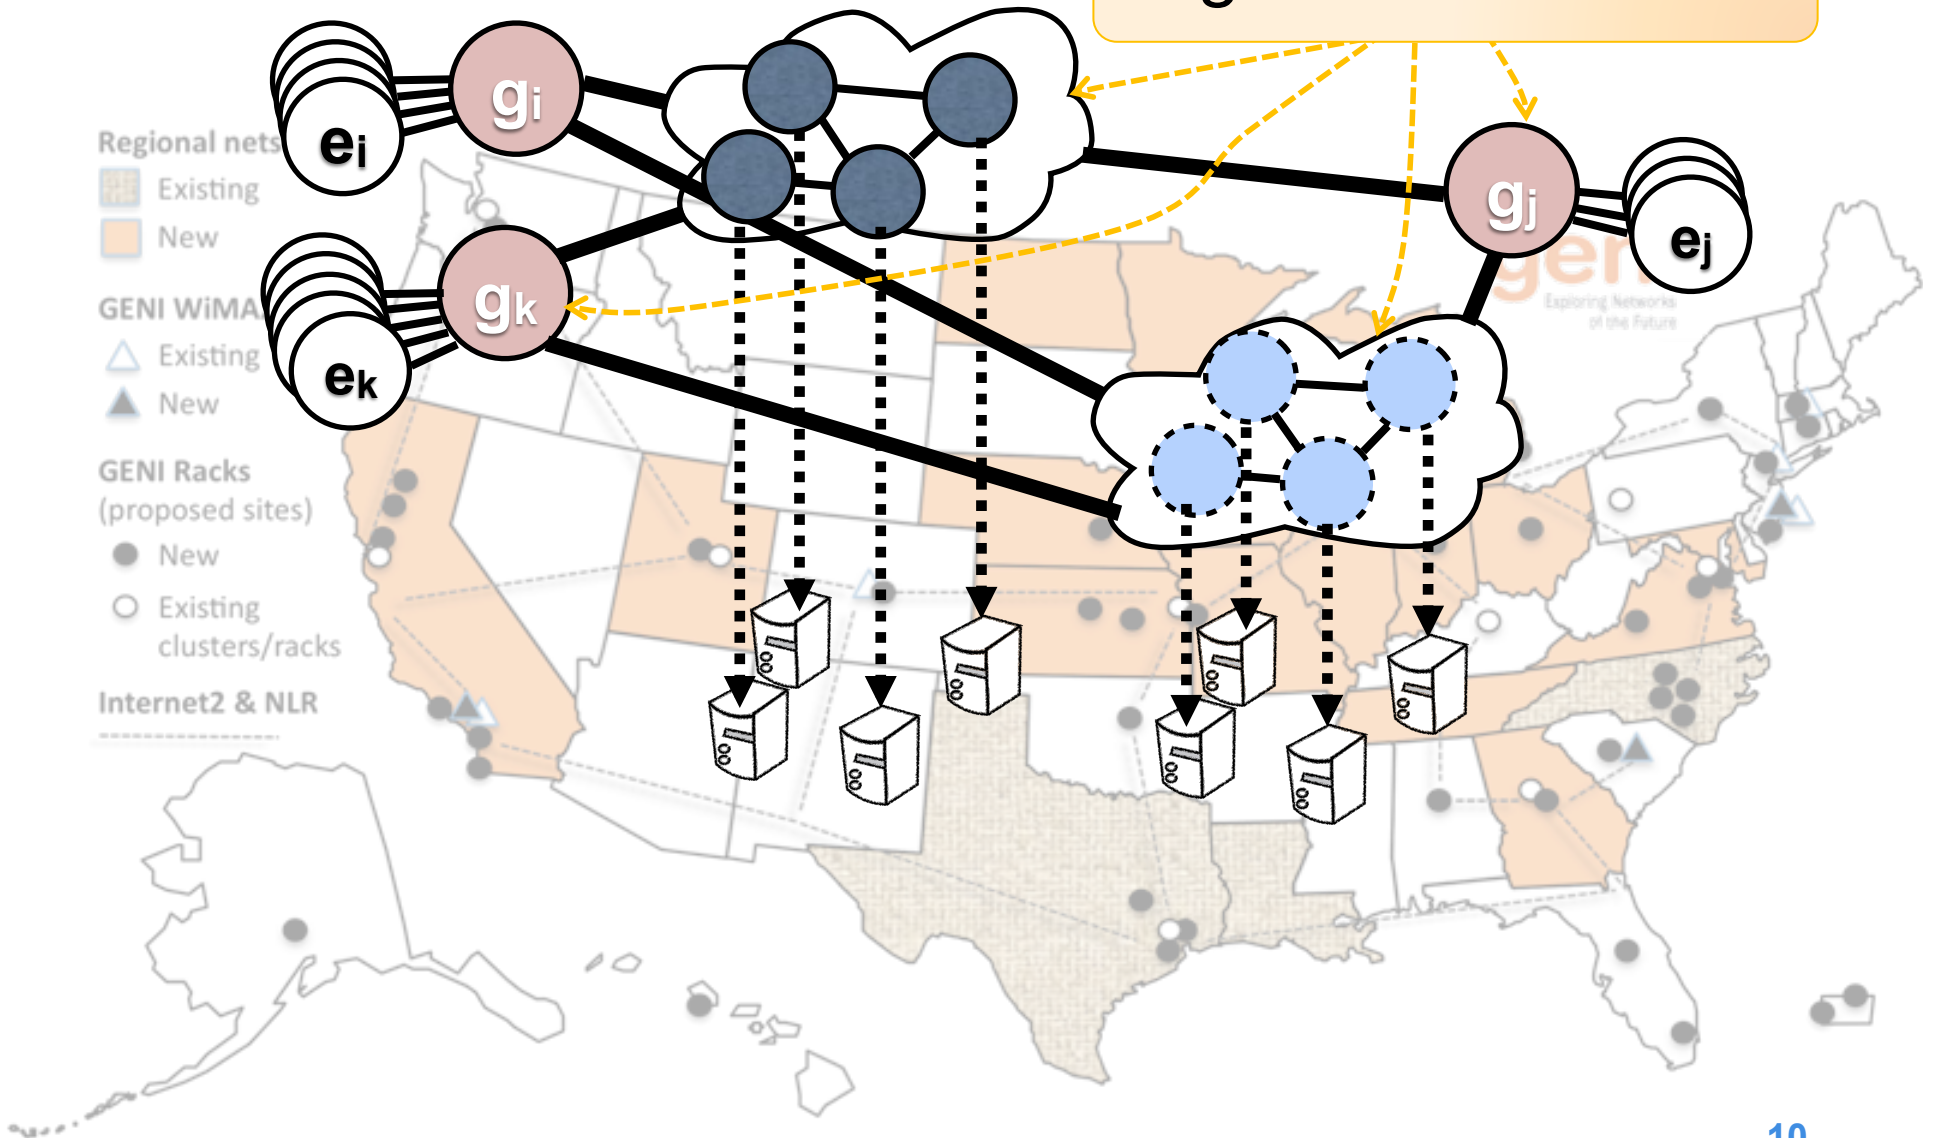

- PlanetLab
 - Experimenters often experience node failure or insufficient resources for their experiments
- Architecture of VN migration on PlanetLab
 - Migration controller – PL-VNM
 - Migration process
 - Migration schemes
- Insights and lessons:
 - Constraints for VN migration on PlanetLab
 - Recommendations for future infrastructure to facilitate VN migration

VNs on GENI

- Layer 3:
Routing tables
- Layer 2:
Flowtables

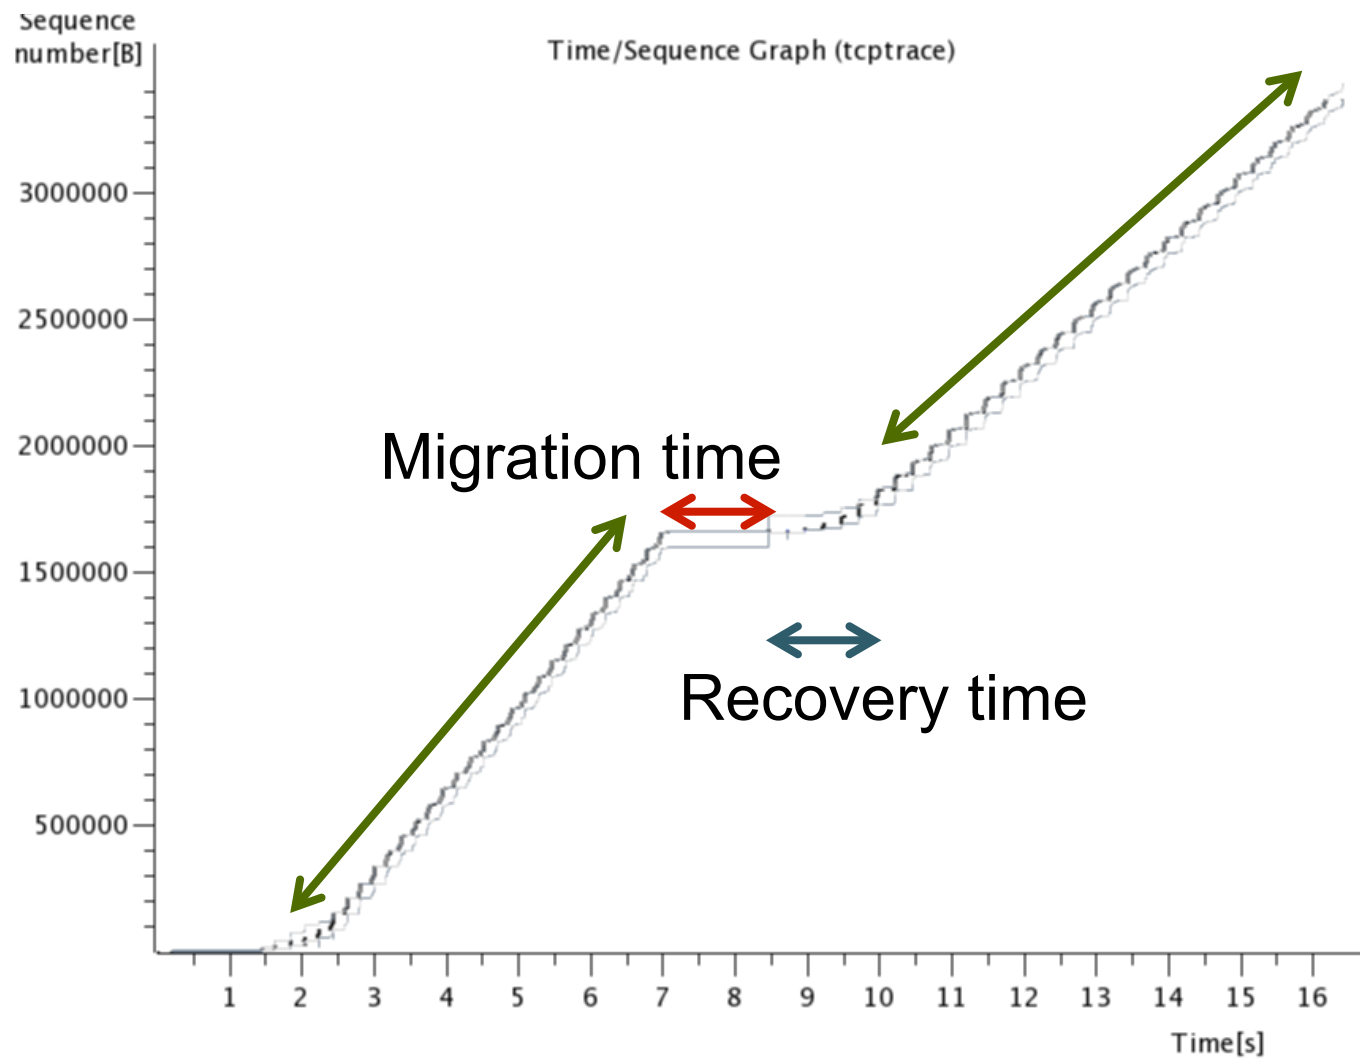

Migration Controller

Work in Progress

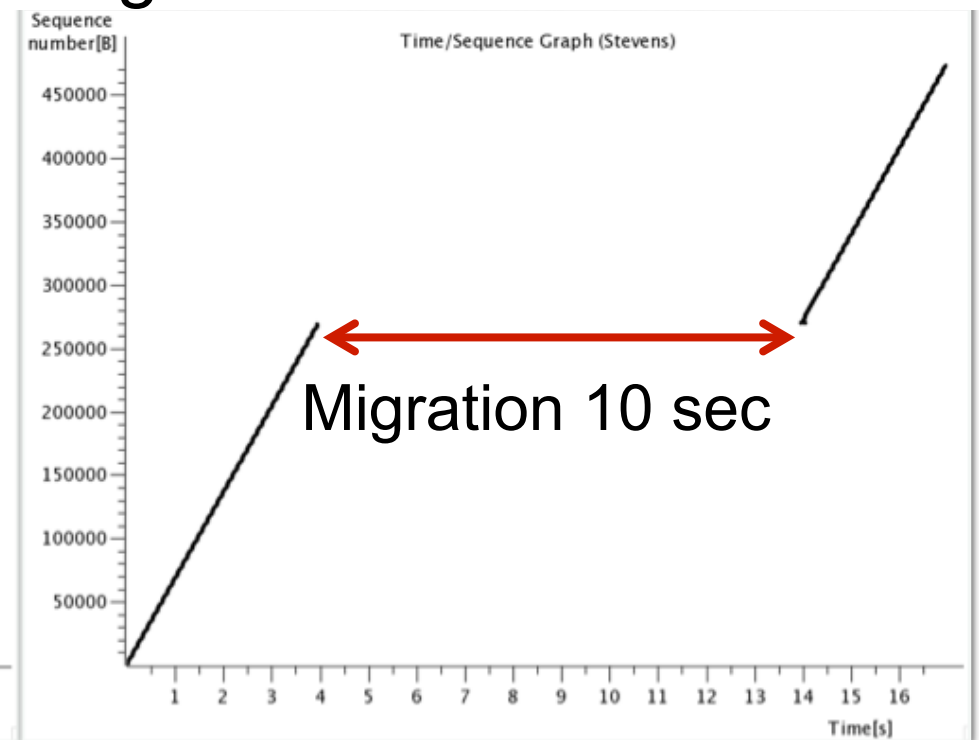

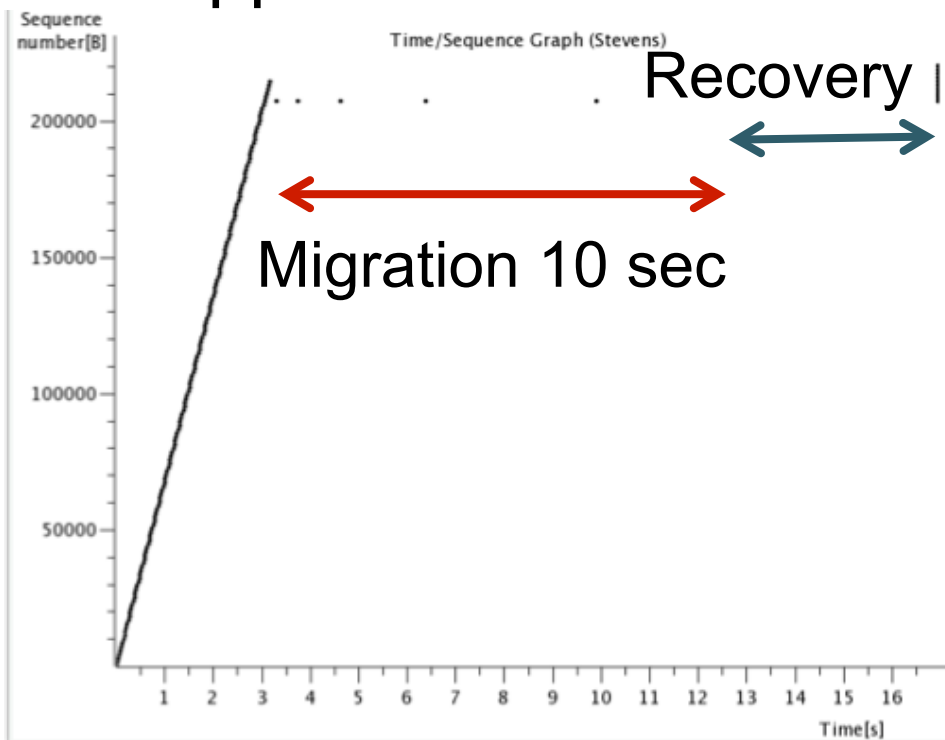

- Migration controller for GENI
- Effects on end-systems and applications
 - How to mitigate known disruptions

TCP Trace during Migration

Mitigate Scheduled Network Disruptions

- Centralized controller
- Notify end-systems and applications
- Application: Video streaming

Summary

- Migration controller for GENI
- Centralized controller to mitigate the effects on end-systems and applications

Thank you!

Q&A
