We are trying to make the information of social context and relationship explicit!

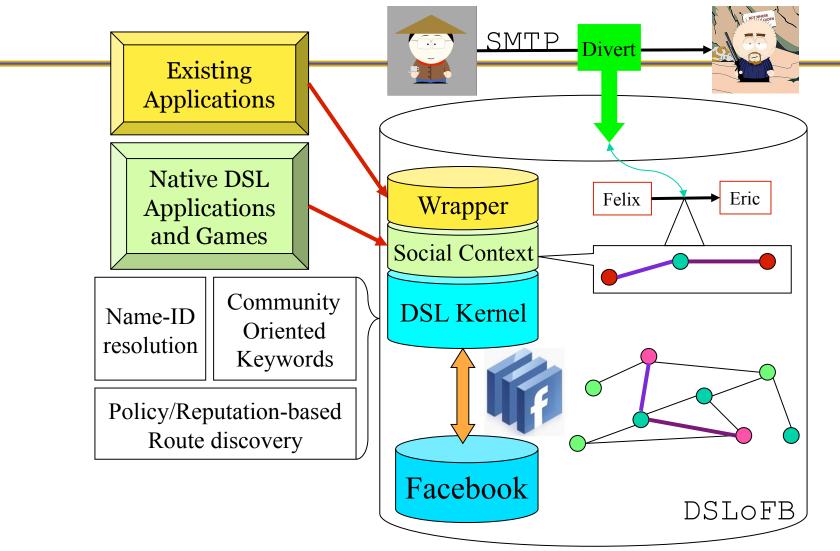

## GENI Experiment

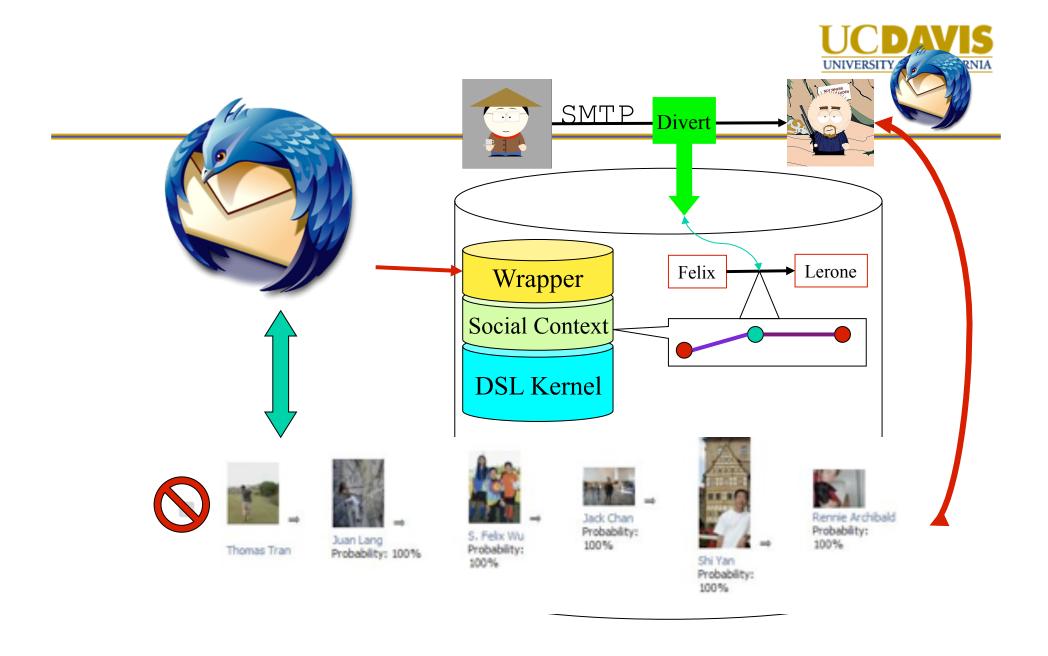

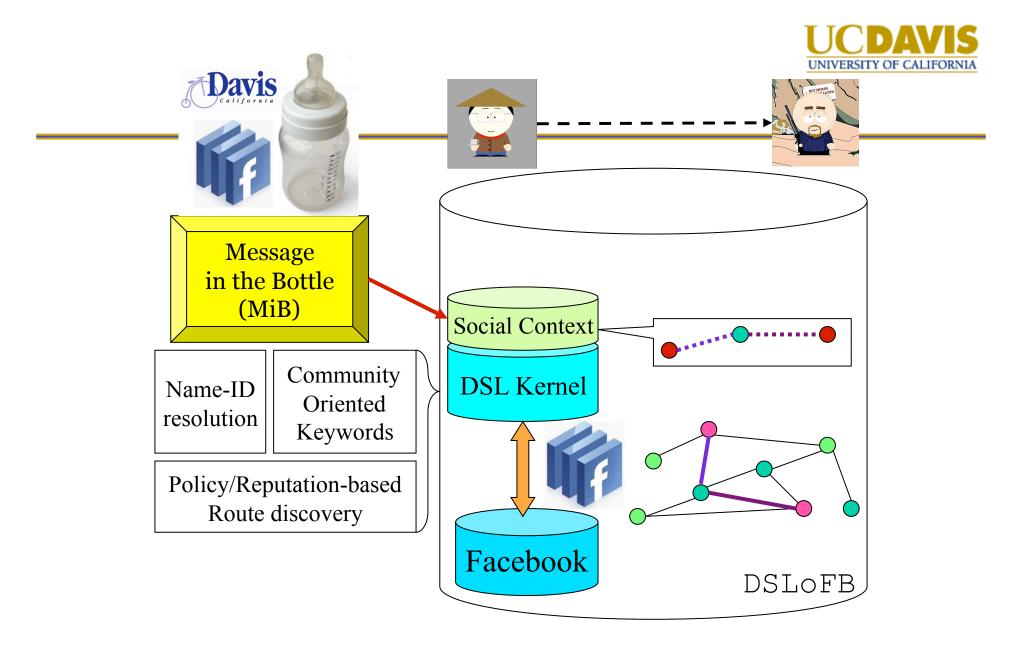

11/17/2009

Davis Social Links @ GEC6/ Experiment Workflow and Services, Salt Lake City, Utah

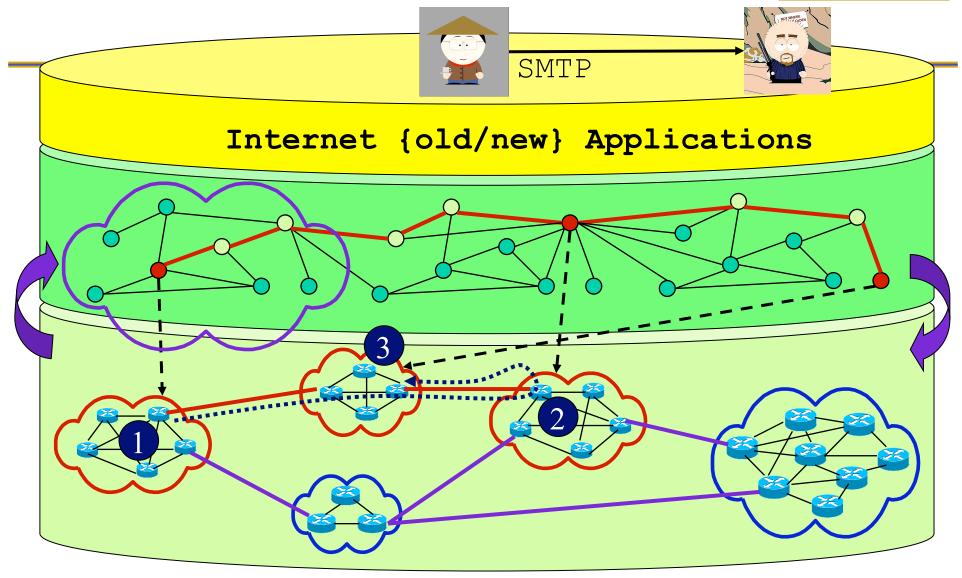

## Three Layers

- User Access layer
  - Native & Existing Applications
- Social Control Layer
  - The core of DSL
- Network Control Layer
  - Network Virtualization

### ISP + SCSP(Social Community Service

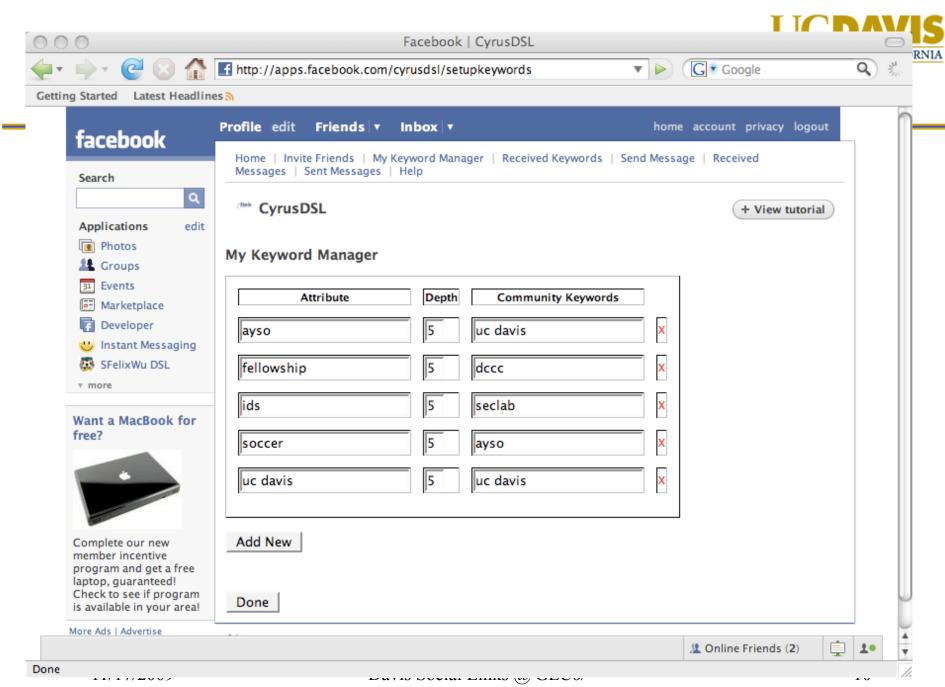

#### · Attributes:

- {McDonald's Express, 640 W Covell Blvd, # D, Davis, (530) 756-8886, Davis Senior High School, Community Park, North Davis}

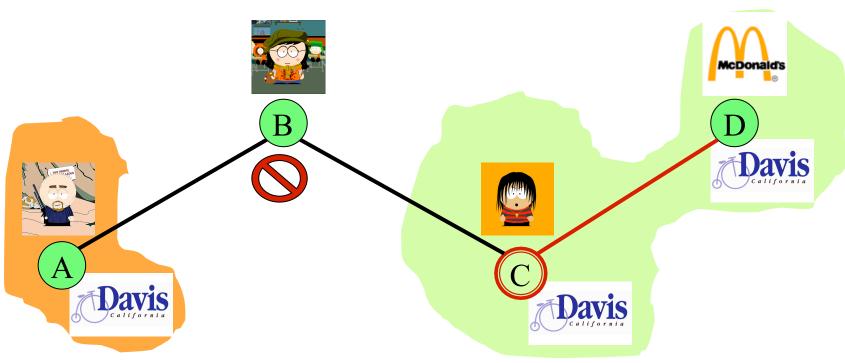

11/17/2009

# Davis Community

 A connected graph of social nodes sharing a set of community attributes

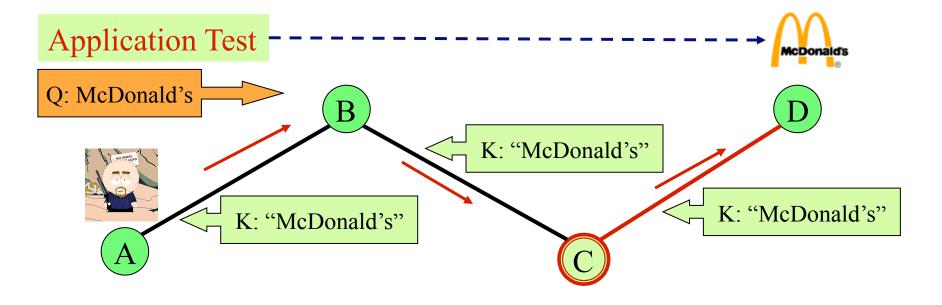

### GENI Experiment

- Leverage (and discover) the "features" of ProtoGENI as much as possible for our NSF FIND project.
- Build something on "DSL" that is attractive and usable by real users
  - feedback to the FIND/GENI community
- Share and reuse the experiments (data traces and models, under IRB)

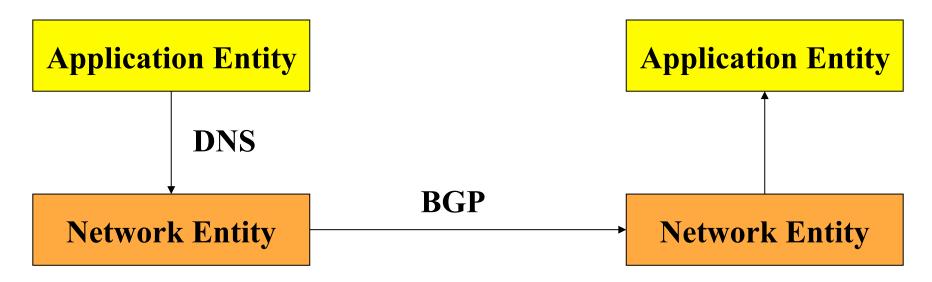

Search Keyword: "McDonald's"

Questions: is this the right McDonald's?

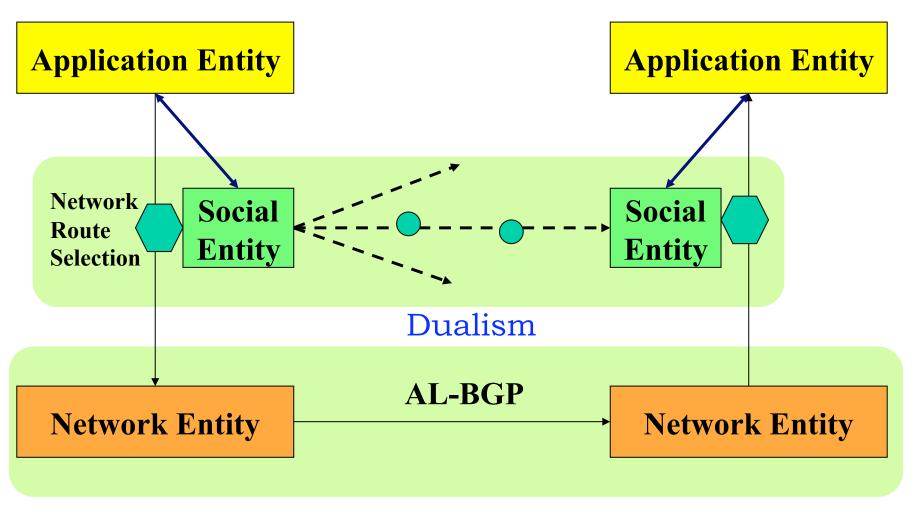

# "Routable Identity"

- Application identity = M=> Network identity
- Network identity =R=> Network identity
- Network identity = M=> Application identity

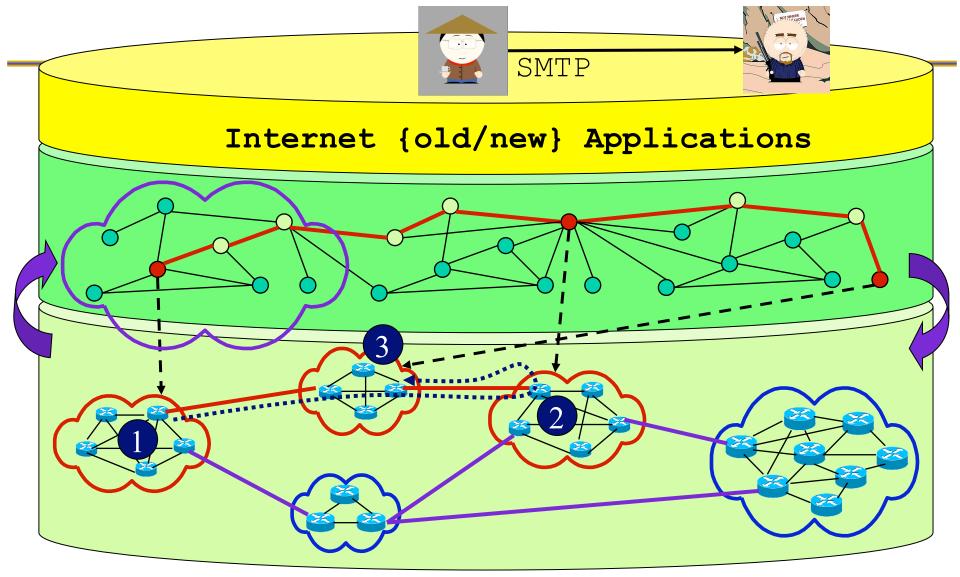

# "Social Control Layer"

### ISP + SCSP(Social Community Service

### Requirements

#### Duration:

- Is the intended experiment short-lived (e.g., requiring more interactive features) or long-lived (e.g., requiring (error) event notification rather than interactive support)

### · Layering:

- What layer of abstraction does the experiment want to control?

#### · Domain:

- What type(s) of resources does the experiment need?

#### · Scale:

- How many resources comprise the experiment?

#### Duration:

- Is the intended experiment short-lived (e.g., requiring more interactive features) or long-lived (e.g., requiring (error) event notification rather than interactive support)
- We need **24/7** for a number of years. (Long-Lived)
- We will also need some capability to support robustness and automated reset/reload (and consistently recover the system state as much as possible)

The following phase transition should be transparent to the DSL users.

- · Layering:
  - What layer of abstraction does the experiment want to control? (e.g., does it need to control the topology and link characteristics? or does it need to completely replace IP with a new packet format and router processing? does it need to control/install in-network transport services e.g., retransmission or encryption, or ... service? or does it need to control placement of application-level (e.g., P2P) services? etc)
- Phase #1: Social Control layer but over an traditional IP/ Facebook layer.
  - focusing on Social-based Access Control
- Phase #2: DSLNet (I.e., no IP addresses and DNS in the OSN kernel)
  - Routers need to exam social context information for forwarding a packet

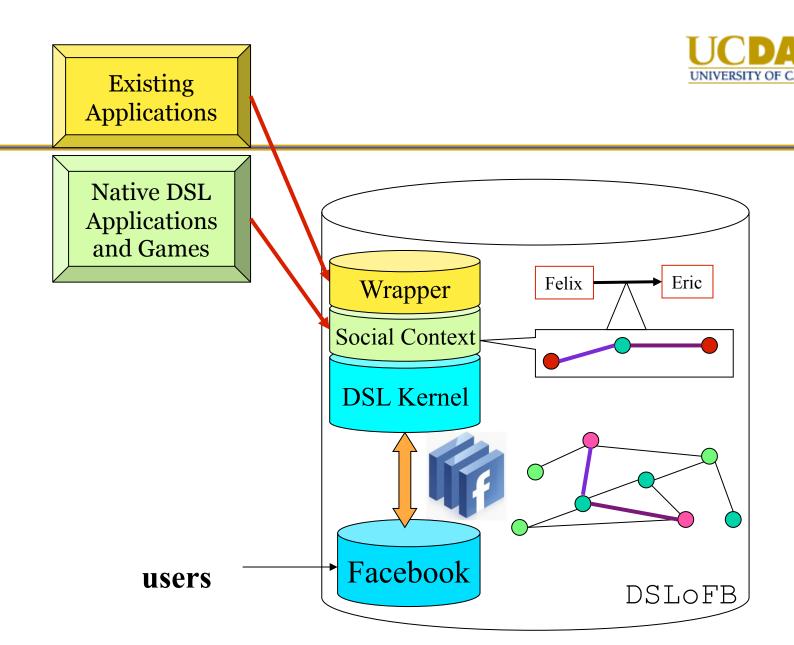

- Layering:
- Internet-based Access to ProGENI
- Currently, ALL DSL/FB users will need to go through both <u>www.facebook.com</u> and <u>dsl.cs.ucdavis.edu</u>
- We like to create a few SCSP (Social Context Service Providers) within ProtoGENI such that the service can be decentralized more.

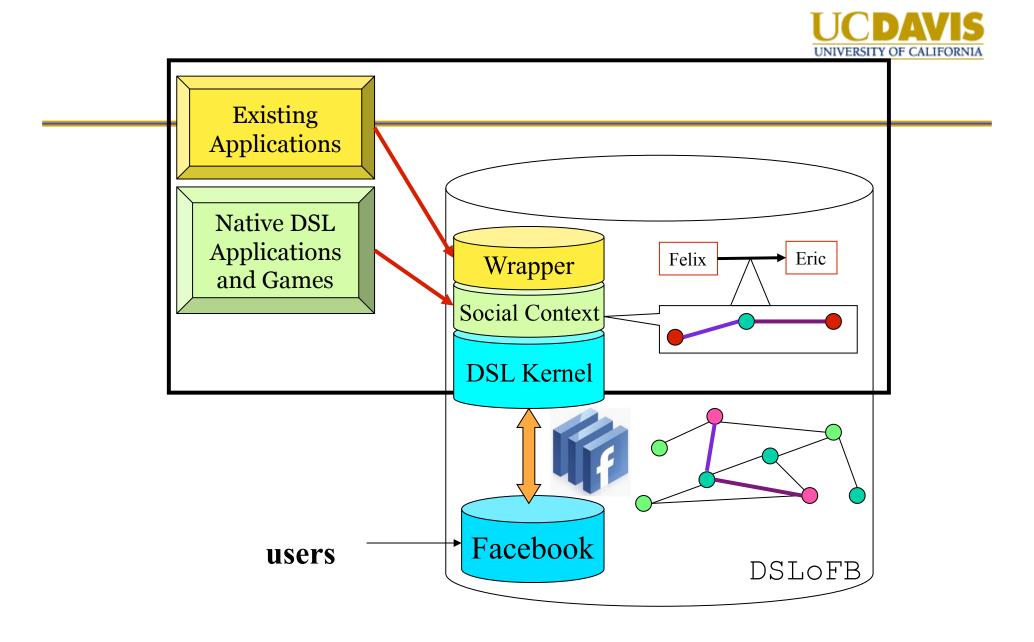

Salt Lake City, Utah

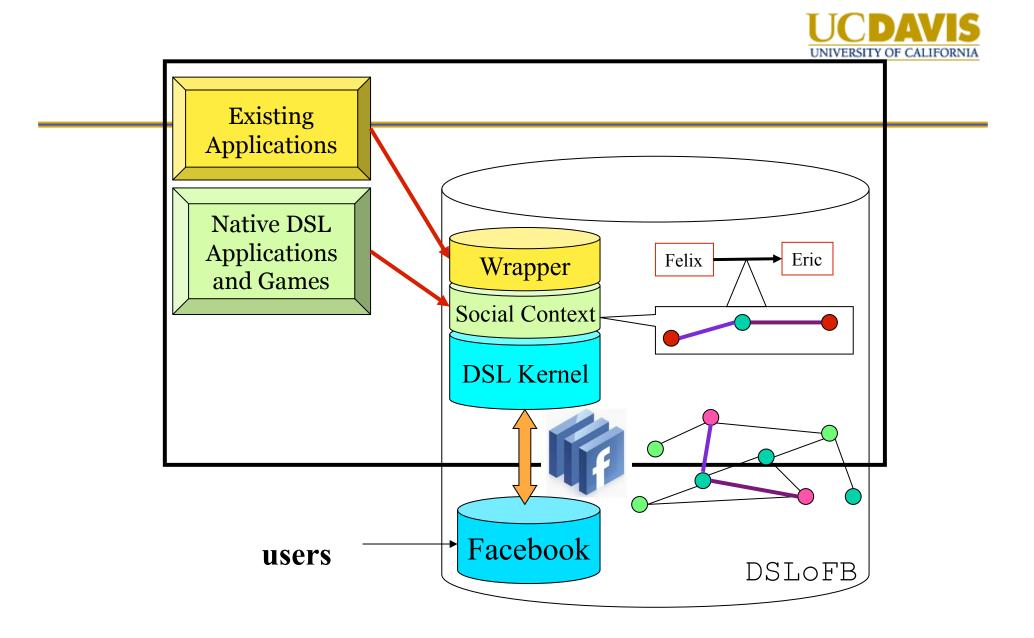

Maybe some DNS tricks

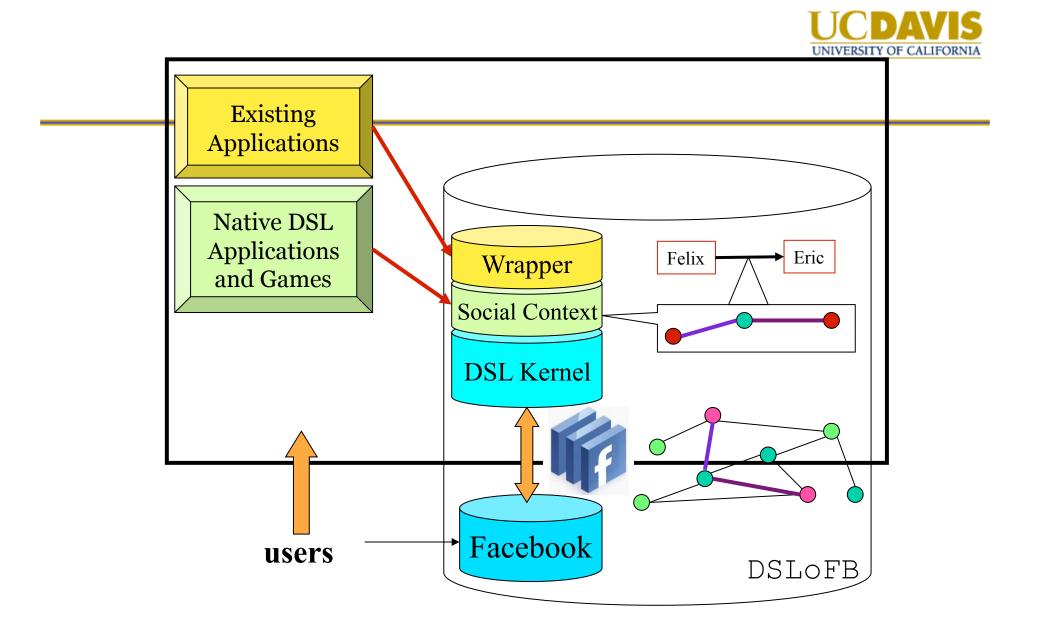

- · Layering:
- Internet-based Access to ProGENI
- Alternatively, we can create a bunch of SCSP's (like Facebook, Orkut, MySpace Twitter) to allow diversified access to ProtoGENI. Then, the OSN's get re-united within the ProtoGENI.

#### Domain:

 What type(s) of resources does the experiment need? (e.g., wireless, wired, mobile, sensor, storage, ..., or some combination)

#### Wired

openflow to bypass Facebook

### Storage

- for both DSL kernel OSN graph and space for individual users
- Custom OS/Software Images

#### · Domain:

- What type(s) of resources does the experiment need? (e.g., wireless, wired, mobile, sensor, storage, ..., or some combination)
- On-the-fly, allocation and migration
  - Predicting Twitter messaging bursts and exploring the social locality (and mapping this to cluster mobility)

Salt Lake City, Utah

#### · Scale:

- How many resources comprise the experiment? (e.g., very large experiments will need tools that help manage large sets of resources collectively rather than individually; whereas small experiments may want tools that interact with each resource individually).
- Initially, our experiment will be small scale, but we are looking forward to the "growing pain".
