

# GENI

## Train the TA – Session 2

**Ben Newton, Jay Aikat, and Kevin Jeffay**

**University of North Carolina at Chapel Hill**

- Hands-on – Named Data Networking Experiment
  - Using Omni, the GENI AM API and Rspecs
- Tips for running a class on GENI
- Wrap-up

# Behind the Scenes of GENI Experimentation *featuring Named Data Networking*

- Reinforce new concepts using a Named Data Networking (NDN) based experiment\*
  - New concepts: RSpecs and AM API
- Named Data Networking (NDN)
  - A Future Internet Architecture (FIA) project\*\*

\* Based on a classroom exercise developed by Sonia Fahmy, Ethan Blanton & Sriharsha Gangam of Purdue U.; Christos Papadopoulos & Susmit Shannigrahi of Colorado State U.

\*\* <http://named-data.net>

## PRINCIPLE

Focus on **what** you need; **not on where** you find it

## TODAY

Must know the **location** of information (aka URL)

- Search engines map the *what* to the *where*
- Most Internet information look-ups start with search engines

## CCN (NDN)

- New network architecture reflects Internet usage
- CCN protocols cache data at all network levels
  - routers, hosts

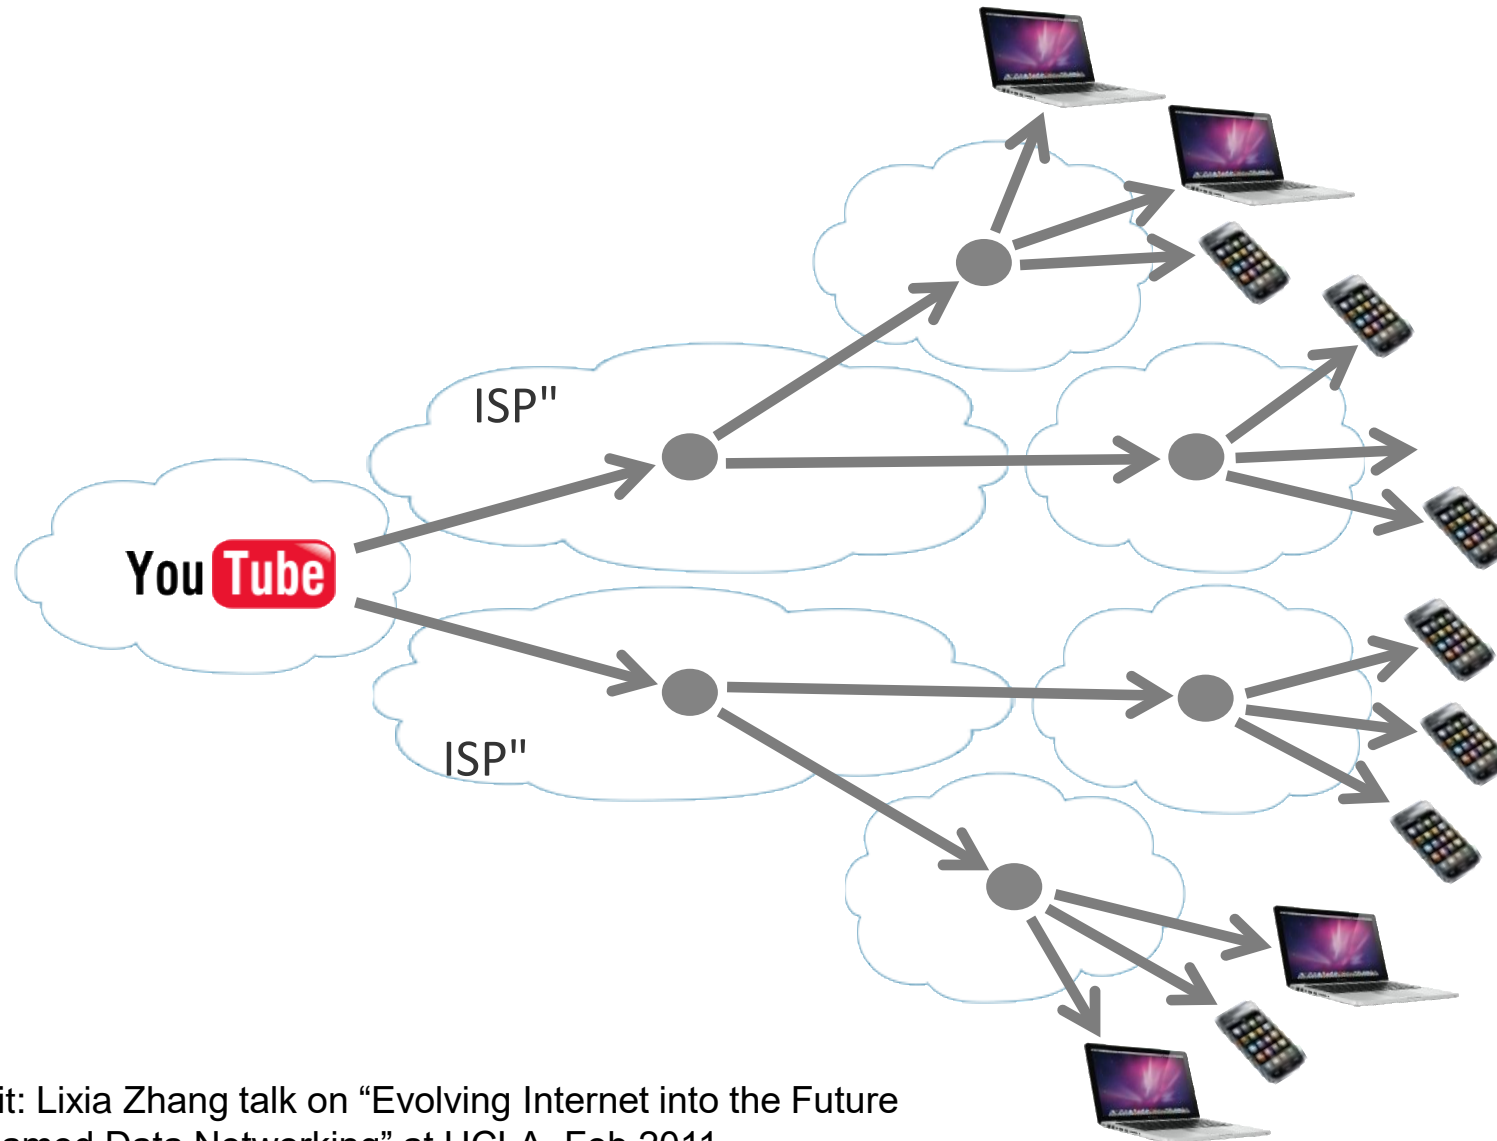

# Point-to-point for data distribution

Today

Credit: Lixia Zhang talk on "Evolving Internet into the Future via Named Data Networking" at UCLA, Feb 2011.

# NDN: Scalable Data Dissemination

Credit: Lixia Zhang talk on "Evolving Internet into the Future via Named Data Networking" at UCLA, Feb 2011.

- An implementation of NDN by Xerox PARC
- Our exercise uses CCNX software
  - Software runs on all nodes in our experiment
  - All nodes cache information that passes through them
  - When a node gets a data request it:
    - Returns data from local cache, if available
    - Passes request to neighbor if data not in cache
    - Caches data returned by neighbor

<http://www.ccnx.org>

**Collaborator**  
(collab)  
fetches data by  
name.  
Requests  
not in cache  
forwarded to  
researcher.

**Researcher**  
(rschr)  
fetches data by  
name  
(e.g. precip  
data from  
1901/01/01 to  
1901/01/02).  
Requests  
not in cache  
forwarded to  
router.

**Intermediate  
node** (router).  
Requests  
not in local  
cache  
forwarded to  
data source.

**Data Source**  
(dsrcl): Holds  
precipitation  
data from  
1 Jan 1901 to  
31 Jan 1902  
(data from  
NOAA)

- Log into the researcher node (`rsrchr`) and fetch data
  - Use a client program already installed on the node
    - Installed using an install script in the RSpec
- Note how long it takes to get data
- Fetch same data again and note time
- If time permits
  - Repeat the above at the collaborator node (`collab`)
    - Data is not in local cache but in `rsrchr` node cache
  - Fetch new data at the collaborator node (`collab`)
    - Data is not in local cache or in `rsrchr` node cache
- Later: Use GENI Desktop/GEMINI to view graphs of traffic on links
  - Helps visualize when data comes from a local cache and when it comes from a neighbor

- **Configure Omni** (Step 2.2 of instructions)
- **View and edit an RSpec** using Jacks (Steps 3.2 – 3.5)
- **Request resources** specified in RSpec using Omni (Step 3.6)
- When resources are ready, log into a node to **run the CCN application** (Step 5)
- (Later) **Visualize the experiment** using the GENI Desktop and GEMINI
  - GENI Instrumentation and Measurement system

- Cut-and-paste is your friend!
  - Cut-and-paste URLs, commands, etc. from instructions into text boxes, terminal windows, etc
- If at any step you don't understand why you are doing something, ask!
- If you fall behind, let us know!
  - We will help you catch up

# Running a Class in GENI

# GENI Accounts and Projects

**Resources for Instructors**

**Tips**

**Wrap Up**

Leverage InCommon for  
single sign-on authentication

## InCommon®

Experimenters from 304  
educational and research  
institutions have  
InCommon accounts

For many experimenters:

- no new passwords
- familiar login screens

**GENI Project Office** runs a federated IdP to  
provide accounts for non-federated organizations.

**Asymmetric cryptography**, a.k.a. public-key cryptography is based on using **different keys** for encryption and decryption

Only the private key can decrypt challenges created with the public key. Private key is usually protected with a passphrase.

[http://en.wikipedia.org/wiki/Public-key\\_cryptography](http://en.wikipedia.org/wiki/Public-key_cryptography)

## Projects organize research in GENI

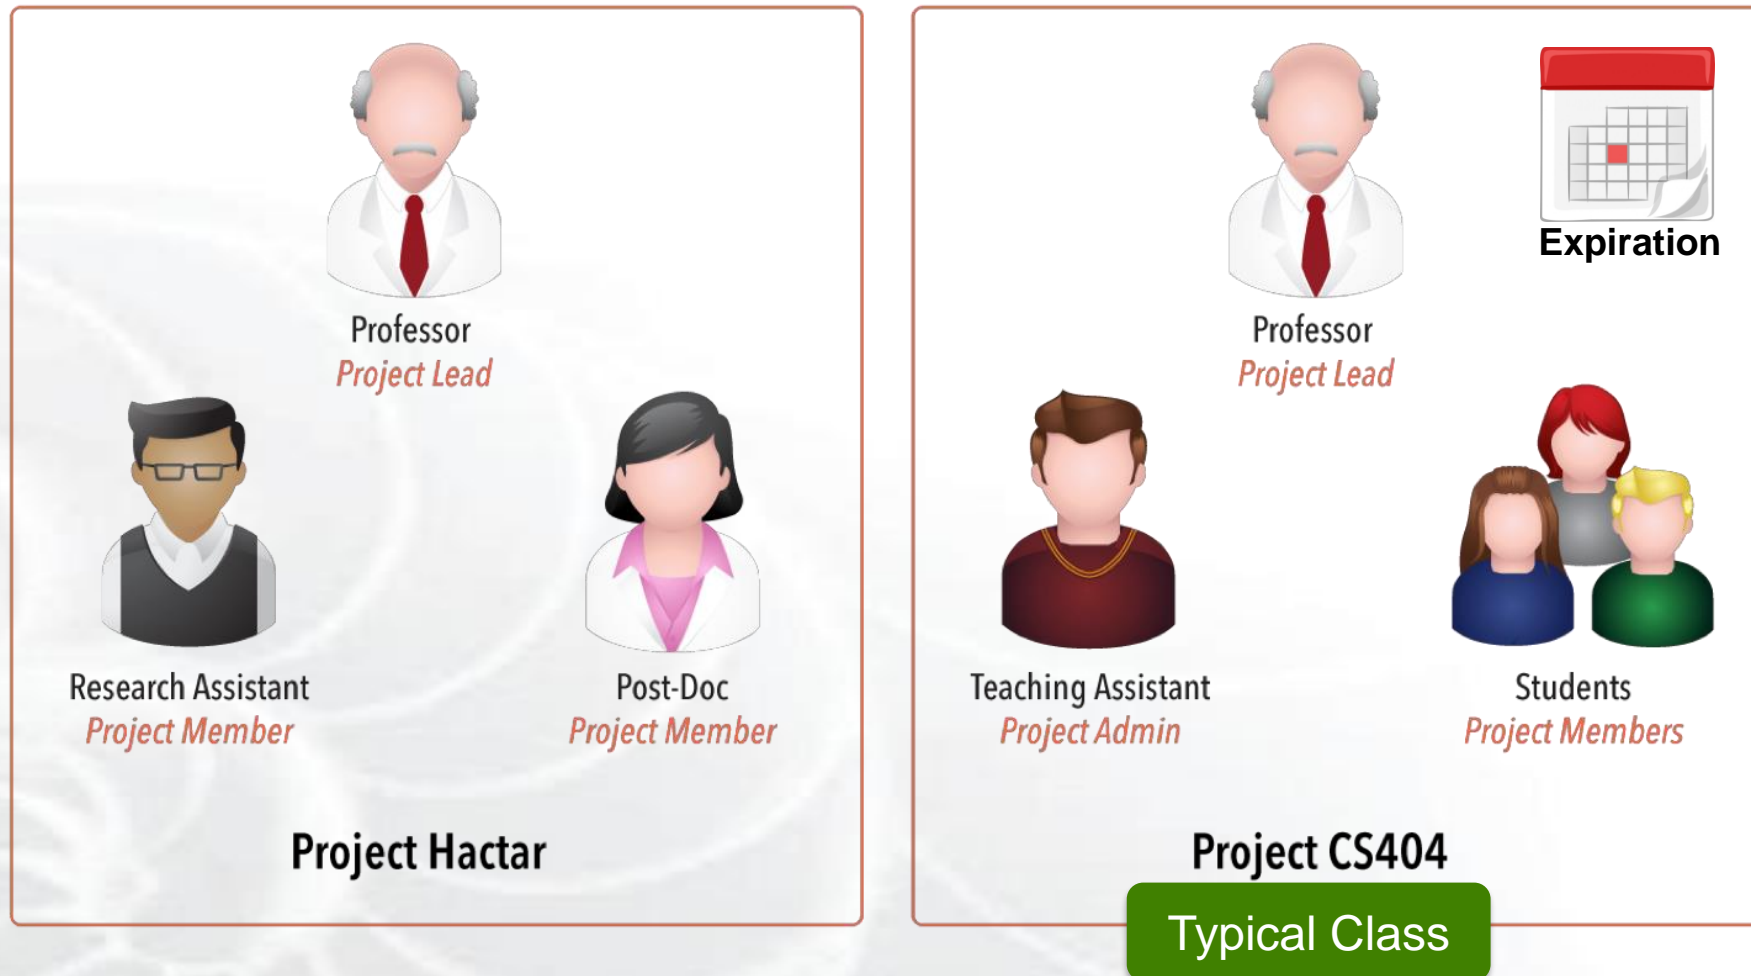

Projects contain both **people** and their **experiments**

A project is led by a single responsible individual:  
the **project lead**

# Project Membership example

Projects have 1 **Lead** and any number of **Admins**, **Members**, and **Auditors**

<http://groups.geni.net/geni/wiki/GENIConcepts#Project>

## 1. Member-initiated

Each experimenter asks to join a project, approval needed

- Typical for Research projects

Project	Purpose	Project Lead	Join
ADAMANT	Use GENI to demonstrate use in data-driven computational workflows	Ilya Baldin	<input type="button" value="Join"/>
ASU-GREE-Summer-Camp-2013		Violet Syrotiuk	<input type="button" value="Join"/>

## 1. Admin-initiated

Project Lead/Admin bulk-adds experimenters

- Typical for Classrooms or Tutorials

### Upload Project Members

#### Action Legend

**Add as ...** Candidates who already use the portal will be added to your project with the specified role immediately.

**Invite as ...** Others will receive an invitation email with instructions on joining your project.

Candidate Name	Candidate Email	Action
Niky Riga	nriga@bbn.com	Already Member
Sarah Edwards	sedwards@bbn.com	<input type="button" value="Add as Member"/>
Vic Thomas	vthomas@geni.net	<input type="button" value="Invite as Member"/>

Slices have:

- 1 **Lead** (person who **created** the slice)
- any number of **Admins**, **Members**, and **Auditors**
- **Project Lead/Admins** added as slice Admins

<http://groups.geni.net/geni/wiki/GENIConcepts#Slice>

# Project and Slice Roles

		<b>Create project</b>	<b>Modify project &amp; manage membership</b>	<b>Create slice</b>	<b>View project</b>
<b>Project</b>	Lead	✓	✓	✓	✓
	Admin		✓	✓	✓
	Member			✓	✓
	Auditor				✓
		<b>Manage slice membership</b>	<b>Act on slice</b>	<b>View slice</b>	<b>Account/keys loaded on slice</b>
<b>Slice</b>	Lead	✓	✓	✓	✓
	Admin	✓	✓	✓	✓
	Member		✓	✓	✓
	Auditor			✓	✓

<http://groups.geni.net/geni/wiki/ProjectSlicesRoles>

Being a member of a slice means you can act on a slice:

- Add resources
- Check status
- Delete resources
- Renew resources

**With any tool!**

The screenshot shows a web interface for managing a slice. It is divided into four main sections:

- Slice Actions:** Contains buttons for "Add Resources", "Resource Status", "Details", "Add Note", and "Delete Resources".
- Renew:** Displays the expiration date "Slice expires on 2014-01-13 00:00:00 UTC". It includes radio buttons for "slice only" and "slice & all resources" (which is selected), and a "Renew" button next to a date input field showing "2014-01-13".
- Tools:** Features a "Launch Flack" button with a map icon, and buttons for "GENI Desktop" and "Use omni".
- Ops Mgmt:** Contains buttons for "Disable Slice" and "Shutdown Slice".

# Slice Access: Logging in to resources

**Slice membership does *not* always guarantee ability to login to resources!**

To ensure access in student's resources:

**Option 1: Reserve resources from Portal/Jacks/Omni [recommended]**

- fix the membership of the slice before reserving resources

**Option 2: Ensure common public key is loaded**

- distribute common public key to students
- ask students to upload it in their profile
- use corresponding private key to login

**Ability to login can help in debugging!**

## Creating Repeatable Computer Science and Networking Experiments on Shared, Public Testbeds

by S. Edwards, X. Liu, N. Riga

In *Operating Systems Review*, Jan '15

For students designing their own experiments

Concise advice for novices on designing experiments to run on a testbed:

1. Formulate a clear plan
2. Automate the execution/analysis of your experiment using best practices
3. Build scalable experiments  
a.k.a. Start small. *Then* scale up

Plus a case study created by a PhD student.

[Link to ACM Library](#)

- **List of sample assignments and tutorials:**

- Use as they are
- Modify to meet your needs

- **Annotated:**

- Type
- Purpose
- Resources needed
- Difficulty/Duration

- **Each sample exercise has:**
  - Handouts / Instructions for students
  - Further information about the instructors
  - For solutions email [help@geni.net](mailto:help@geni.net)
- **Instruction format:**
  - 3 Steps based on standard experiment lifecycle

## Tutorials:

- **Lab Zero**  
Basic GENI understanding, ensures students setup their environment
- **Intro To OpenFlow**  
Basic OpenFlow introductory tutorial, students learn how to setup OVS and write simple controllers

## Assignments:

- **IPv4 Routing**  
Students understand IPv4 forwarding and how to configure static routes
- **TCP Network Awareness**  
Students explore different TCP flavors and TCP parameters

Tutorials: <http://groups.geni.net/geni/wiki/GENIExperimenter/Tutorials>

Assignments: <http://groups.geni.net/geni/wiki/GENIEducation/SampleAssignments>

geni.web.unc.edu

The screenshot shows the GENI Education Modules website. At the top left is the 'geni education' logo. To the right are navigation links: 'Home', 'Modules' (highlighted), 'Instructors', and 'About'. Below the navigation is the heading 'Education Modules'. There are six module cards arranged in a 2x3 grid:

- geni portal**: GENI Setup. Introduces the basics of GENI Portal, and Flack by walking through the process of creating a slice, designing a network, and adding resources to a slice.
- genidesktop**: Instrumentation. Introduces the basics of GENI Desktop, walking through the process of instrumentizing a slice and opening graphs and SSH sessions for the nodes.
- Web Server**: A hands-on experience installing and interacting with a web server. First, install and start a web server. Then, generate a simple HTML file and retrieve it on a client node.
- TCP Traffic**: TCP Traffic. Generate and analyze TCP flows. Iperf is used to create a flow and view the sawtooth behavior. Then, a second flow is introduced to show how TCP flows share a link.
- Effect of RTT and Window Size on TCP Throughput**: Experiment with how RTT and TCP window size affect TCP throughput. Learn how to adjust the RTT of a TCP connection by adding delay, as well as how to adjust the window size of an iperf TCP flow.
- ping TCPDUMP**: Traffic Analysis. Introduces key tools for network traffic analysis, featuring ping and tcpdump.

## 1. Figure out GENI Resources/Tools

- Wireless/Wired
- Flack, Omni, Portal, I&M?

## 2. Test your exercise

## 3. Adjust writeup for GENI

- Remember to include Clean Up!

- **Run through the exercise**
- **Automate:**
  - Install scripts (HowTo/WriteInstallScripts)
  - Custom Image

**Create RSpec that instantiate the topology**  
– install scripts, images are included

## 1. Students make the reservation:

- RSpec (URL, File, Upload it in Portal)
  - Or the topology if they are just drawing it in Flack (e.g. Lab 0)
- AMs, Tool

## 2. \*Admin (Prof., TA) makes all the reservations:

- Create a Slice per student/group
- Make the student(s) member of the slice
- Ensure they have keys (email us if needed)
- Reserve resources **from the Portal or omni**
- Omni scripts automate this process

\* **Lab Exercises:** Resource reservation might take time

**Assignments:** Resource reservation is complicated/unique or out of scope

# GENI Accounts and Projects

## Resources for Instructors

**Tips**

**Wrap Up**

## Tip #1: Load Balance the students

- Split students/groups between equivalent resources (e.g. racks) to avoid resource contention
- If using scarce resources consider a rolling deadline

### **GMOC: GENI Meta-operation Center**

- Keeps track of outages
- Notification system for resource reservation

### **GMOC Google Calendar keeps track of reservations/outages**

<http://groups.geni.net/geni/wiki/HowTo/PreReserveGENIResources>

- **Use their personal laptop**
  - **LabZero** is a good way to get setup
  - There are Mac/Windows Binaries for Omni
- **Use Lab computers**
  - Go through the exercises in lab computers
  - stress-test the resources or split students
- **Use a VM with all the software loaded**
  - <http://groups.geni.net/geni/wiki/HowTo/CreateTutorialVM>

**Make sure they test it early in the class!**

## Tip #4: Accessing GENI Resources: SSH

Login to all GENI compute resources using  
*ssh keys – no password*

If you are ever **prompted** for a **password** during login to **GENI nodes** something is **wrong**

Using key-pair to SSH:

**Public key:** is public to everyone, loaded to nodes

**Private key:** kept private in your computer, provided to SSH to verify it matches the loaded public key

- Students might not be familiar with CLI
- Students might not be familiar with public key cryptography
  - Hard to distinguish between private and public
  - Hard to distinguish between password and passphrase

**Consider a brief SSH tutorial/intro**

*<http://groups.geni.net/geni/wiki/HowTo/LoginToNodes>*

## SSH with keys from **Windows** is **non-trivial**

- No built-in ssh client

## Possible Solutions

- BitVise
- FireSSH – javascript plugin for Firefox
- SecureCRT (not free)
- cygwin
- *Linux VM – make use of a slim OS*
- PuTTY (private key format different)

**Need to address this early!**

<http://groups.geni.net/geni/wiki/HowTo/LoginToNodes>

- Ask students to be specific about what is not working
  - Step-by-step run through usually helps
- Ask for what they see:
  - screenshots
  - omni output errors
- Gather as much information as you can
  - get slice name
  - tool they used
  - rspec
- Remember you have access to their slices, check for yourself!
- Register for resource mailing lists
  - Better that you, not the students, contact resource owners

## Problem: Can't login to a node

### Possible causes:

- **Slice/sliver expired**
- Wrong username
- Public key isn't loaded, Private key is wrong or non-existing
- Private key has wrong permissions (it should have 0600)
- Technical issue with node

### Debug strategy:

1. Check the status of the Slice/sliver
2. Try logging in to the node yourself
  - Look for loaded keys

```
sudo cat <student_user_path>/.ssh/authorized_keys
```

3. Ask them to use `'-v'` option

```
ssh -v foo@bar.example.net
```

## Tell your students ...

**Do NOT manually create  
user accounts with insecure  
passwords on your VMs**
